How to approach schema Design?

Database

- ① Scaler will have multiple batches.
About each batch we have to store their name, start month, current instructor.
- ② Each batch of Scaler will have multiple students.
- ③ Each batch has multiple classes.
- ④ For each batch I have to store the name of the class, date and time of the class, instructor of class.
- ⑤ For every student we store their name, grad year, university name, email, phone number.
- ⑥ Each student has a buddy who is also a student.
- ⑦ A student may move from one batch to another.
- ⑧ For every batch a student goes to we need to store the start date.

⑨ Every student is going to have a mentor. For every mentor we store their name, and current company.

⑩ We have to store the info about mentor sessions (time, duration, student, mentor, stud-rating, mentor-rating)

⑪ For every batch if it is ACADEMY or DSML batch.
↓
Data Science
ML

Steps :-

① create the tables

How to identify tables

- ① just find all the nouns that are present in req.
- ② identify the noun, ask yourself if you want to store data about noun
- ③ if Yes, create the table.

Naming conventions

- Name of the table should be plural

Mentors

mentor - sessions

Mentor Sessions

mentor Sessions

⋮

- batches

batch-id	name	start-month	
----------	------	-------------	--

- Instructor

I-id	name	avg-rating	email	
------	------	------------	-------	--

- students

s-id	name	grad-year	univ	email	phone-p
------	------	-----------	------	-------	---------

- classes

class-id	name	scheduled-time	
----------	------	----------------	--

- mentors

m-id	name	-company-name	
------	------	---------------	--

- mentor_sessions

mentor-session-id	time	duration	stud-rating	mentor-rating
-------------------	------	----------	-------------	---------------

- Add all the attributes & the primary key.

Expectations with PK :-

- ① It should rarely change
 - update index
 - re-sorts the data

- ② Data type (int)
 - 1) sort
 - 2) size

→ id

→ {table-name}_id

b-id	b-name	b-std	i-id	i-name	i-avgndf
------	--------	-------	------	--------	----------

why this is
bad design?

Normalisation

REDUNDANCY

How to represent relation? FK

cardinality: when two things are related to each other, how many of one is related to how many of other.

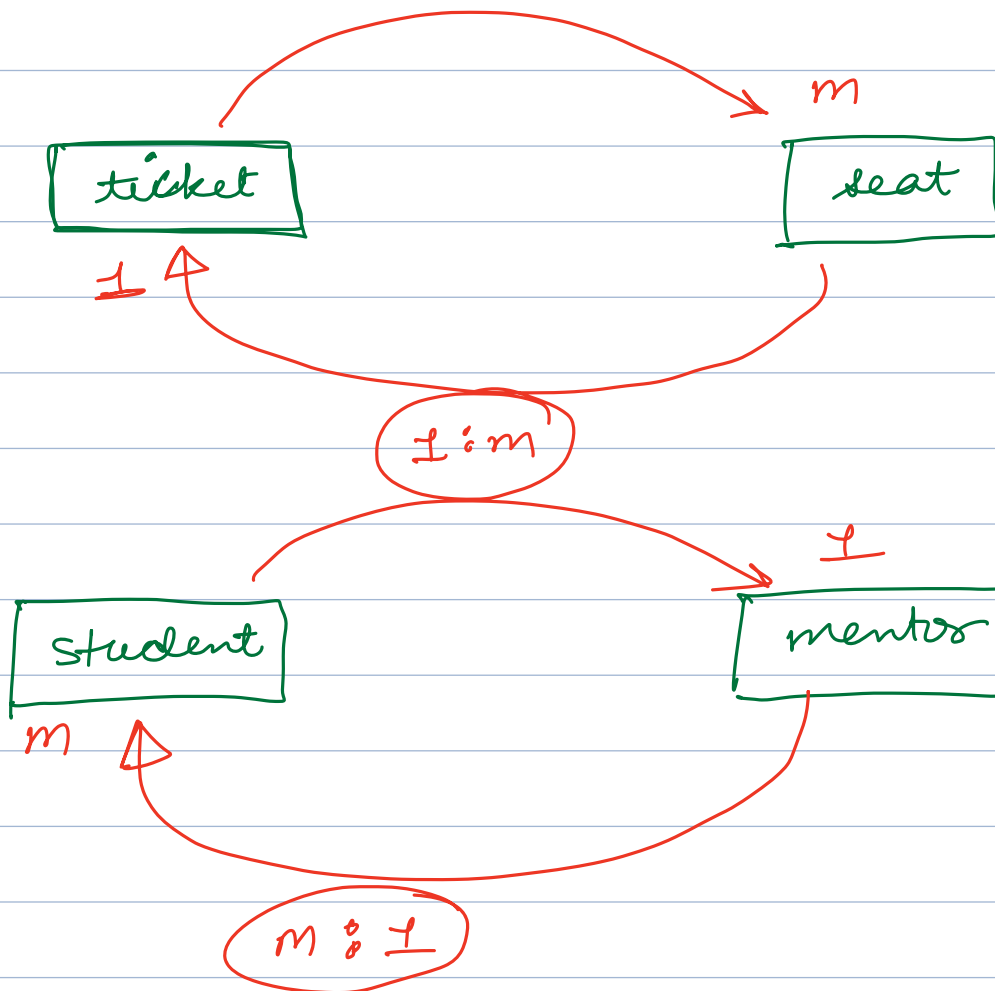

Girl

Boy

$1 : 1$

↓
What relation?

- ① finalise 2 entities
- ② finalise relation

SQL 1 monit
 SQL monit
 SQL monit
 ...

How to represent cardinalities?

$1:1$

$(4) 1:1 (8)$

girl

id	name	b-id
1		4
2		5

Boy

id	name	g-id

id of any (1) side
on the other

1:m or m:1

1
Student
m

1
Mentor
1

atomic

s^aid / s^aname / - / - / m^aid

m^aid / m^aname / ~~st^aid~~
~~[1, 4, 6, 12]~~

m:1

id of 1 side on M side

$m:m$

order

<u>o-id</u>	placedAt	
1	10:00pm	X [4, 6, 10, 12]

products

<u>p-id</u>	p-name	
1	Pen	X [1, 6, 10, 12]

$m:m$
↓
table

order-products

order-id	p-id
1	4
1	5
1	7
2	3
2	4
⋮	⋮

1:1 → store id is one of the table of other one

$m:1$
